Learn about the growing role of genomics in healthcare, patient diagnoses and treatment.

How will genomic data influence patient management?

How will it affect the way we screen for cancer?

How will you respond to a patient concerned about their results from Direct-To-Consumer genetic testing?

What is the 100,000 Genomes Project and which of your patients might be recruited to it?

Genomics is revolutionising medicine, and this online, interactive course is designed to educate healthcare practitioners with the knowledge they need to integrate genomic data into their clinical practice. Through discussions, videos, articles and quizzes, it will provide healthcare practitioners with a basic grounding in genomic medicine. In particular you will consider the current clinical applications of genomics in secondary care, and the likely impact genomics will have on patient diagnosis, treatment, and preventative medicine, including in the primary care setting.

This course is accredited by the RCGP, the RCP and the RCPCH.
